## 1. Introduction

The Waste Reduction Model (WARM) was created by the U.S. Environmental Protection Agency (EPA) to help solid waste planners and organizations estimate greenhouse gas (GHG) emission reductions from several different waste management practices.

WARM calculates GHG emissions for baseline and alternative waste management practices, including source reduction, recycling, combustion, composting, and landfilling. The model calculates emissions in metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>E) and metric tons of carbon equivalent (MTCE) across a wide range of material types commonly found in municipal solid waste (MSW). Moreover, results of energy consumption in million BTUs are also calculated. The user can construct various scenarios by simply entering data on the amount of waste handled by material type and by management practice. WARM then automatically applies material-specific emission factors for each management practice to calculate the GHG emissions and energy use of each scenario. Several key inputs, such as landfill gas recovery practices and transportation distances to MSW facilities, can be modified by the user.

The GHG emission factors were developed following a life-cycle assessment (LCA) methodology using estimation techniques developed for national inventories of GHG emissions. The [model documentation](#) describes this methodology in detail. The WARM model was implemented in the free, open source LCA software [openLCA](#). The resulting openLCA database is used for the calculation of impacts in the WARM Tool described in this guide. The model implemented in openLCA corresponds to the version of June 2015.

## 2. Installation

There are versions of the WARM Tool available for Windows (32 and 64 bit) and Mac (64 bit). In all cases, the tool is provided in a compressed file (\*.zip, \*.gz), which should be first downloaded and then its content extracted (i.e. right click on the file → Extract...).

A folder "WARM" will be then generated. The file "WARM.exe" contained in it should be run to get the application started.

Figure 1. Content of WARM folder when extracted from the compressed file

## 2.1 Hardware and software requirements

Hardware:

- 1 GB RAM
- 140 MB (Windows), 64 MB (Mac) free hard disk space

Software:

- Microsoft Visual C++ Runtime v10 needs to be installed on Windows 64 bit because the WARM Tool contains a browser engine for the display of modern HTML pages, that requires this runtime. If you had not installed it when running the tool, a message like in Figure 2 would be shown. You can download this runtime [here](#).

Figure 2. Message displayed if the MS Visual C++ Runtime v10 is missing

## 3. First start and overview

When first running WARM, the Home page is shown providing some information and tips about the tool.

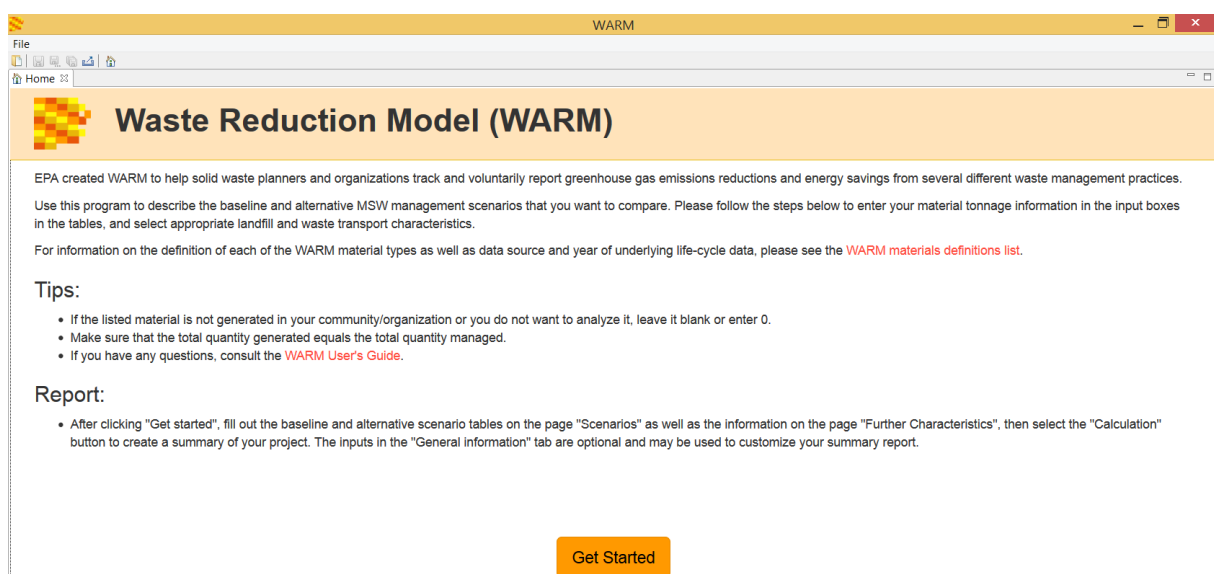

Figure 3. Home tab

If you click the button “Get Started”, a new tab “Data Entry” appears, where the data for the analysis should be inputted by the user. This tab consists of four steps: Scenarios, Further characteristics, General Information and Calculation. You can navigate through them by clicking on the buttons on the top of the tab or on the “Back”/ “Next” buttons in the bottom. You can also use the scrollbar in the right of the window to see the full content of each page. Detailed information about the “Data Entry” tab is provided in [section 4](#) of this guide.

**Waste Reduction Model (WARM)**

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

Please enter data in short tons (1 short ton = 2,000 lbs.) and refer to the User's Guide if you need assistance.

**Baseline Scenario:** Describe the baseline generation and management for the MSW materials listed below. If the material is not generated in your community or you do not want to analyze it, leave it as 0.

**Alternative Scenario:** Describe the alternative management scenario for the MSW materials generated in the baseline.

Each input row will be validated to sum up correctly. The tons generated in the baseline scenario must match the tons generated in the alternative scenario.

A row is valid if the sum of the baseline scenario inputs is equal to the sum of the alternative scenario inputs minus the amount of reduced source.  
As formula (b = baseline, a = alternative):  $b_{\text{recycled}} + b_{\text{landfilled}} + b_{\text{combusted}} + b_{\text{composted}} = a_{\text{recycled}} + a_{\text{landfilled}} + a_{\text{combusted}} + a_{\text{composted}} + a_{\text{sourceReduced}}$

Material	Baseline Scenario				Tons Generated	Alternative Scenario				
	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted		Tons Source Reduced	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted
Aluminum Cans	0	0	0	N/A	0	0	0	0	0	N/A
Aluminum Ingot	0	0	0	N/A	0	0	0	0	0	N/A
Steel Cans	0	0	0	N/A	0	0	0	0	0	N/A

Next

Figure 4. "Scenarios" section of the "Data Entry" tab

Several “Data Entry” tabs can exist at the same time in the software (i.e. various assessments); for creating new ones, just go to the Home's tab and click again “Get Started”. If you had closed it, you could open it again by clicking on the icon of the toolbar.

After the calculation for the entered data is finalized, results will be shown in a new tab “Report”. Detailed information about the results analysis is provided in [section 5](#) of this guide.

It is also possible to save the data inputted in the “Data Entry” tab for future assessments, as explained in [section 6](#) of this guide.

## 4. Data entry

### 4.1. Generate scenarios

Baseline and alternative scenarios can be constructed by simply entering data on the amount of waste handled by material type and by management practice. There are fifty-four [material types](#) (rows) and five management practices available (columns): recycling, landfilling, combustion, composting and source reduction. This last practice is of course only included in the “Alternative Scenario”, and refers to the decrease in waste generation compared to the waste handled in the baseline scenario.

There is an additional column "Tons generated" which is automatically updated by the tool and represents the total amount of waste handled in the baseline scenario, per material type. If data is introduced only for the alternative scenario, this field will remain as "0".

It is not necessary to enter data for all materials and management practices, only for those relevant for your assessment. When no data is added in a specific cell, the value remains as "0". In addition, not all management practices are available for all material types (e.g. food waste cannot be recycled). In those cases, "N/A" is written in the correspondent cell and no data can be inputted by the user.

When scrolling down in the page view, the headers of the table columns will not be visible anymore. However, tooltips are available when typing in or hovering over each cell with information about the corresponding scenario and management practice.

1 Scenarios
2 Further Characteristics
3 General Information
4 Calculation

Each input row will be validated to sum up correctly. The tons generated in the baseline scenario must match the tons generated in the alternative scenario.

A row is valid if the sum of the baseline scenario inputs is equal to the sum of the alternative scenario inputs minus the amount of reduced source.  
 As formula (b = baseline, a = alternative):  $b_{\text{recycled}} + b_{\text{landfilled}} + b_{\text{combusted}} + b_{\text{composted}} = a_{\text{recycled}} + a_{\text{landfilled}} + a_{\text{combusted}} + a_{\text{composted}} + a_{\text{sourceReduced}}$

Material	Baseline Scenario				Tons Generated	Alternative Scenario				
	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted		Tons Source Reduced	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted
Aluminum Cans	50	20	10	N/A	80	10	50	10	10	N/A
Aluminum Ingot	0	0	0	N/A	0	0	0	0	0	N/A
Steel Cans	100	20	0	N/A	120	10	100	10	0	N/A
Copper Wire	0	0	0	N/A	0	0	0	0	0	N/A
Glass	75.5	15	0	N/A	90.5	10.5	75	5	0	N/A
HDPE	0	Base scenario - Tons landfilled	0	N/A	0	0	0	0	0	N/A
LDPE	N/A	0	0	N/A	0	0	N/A	0	0	N/A

Next

Figure 5. Inputting of data in the "Scenarios" section of the "Data Entry" tab

The following requirements exist for entering the data:

- Amounts should be entered in short tons<sup>1</sup>
- Only numbers can be entered (i.e. no formulas supported)
- "." should be used as decimal separator
- The total amount of waste handled in the baseline scenario has to equal the total amount of waste entered for the alternative scenario, per material. A validation is done for each material, and if there were divergences between the quantities generated in each scenario, that row would be highlighted in red and an exclamation mark added in the left of the material's name.

<sup>1</sup> 1 short ton = 2,000 lbs = 907.18 kg

Material	Baseline Scenario					Tons Generated	Alternative Scenario				
	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted			Tons Source Reduced	Tons Recycled	Tons Landfilled	Tons Combusted	Tons Composted
! Aluminum Cans	0	20	10	N/A	30	10	50	10	10	N/A	
Aluminum Ingot	0	0	0	N/A	0	0	0	0	0	N/A	
! Steel Cans	0	20	0	N/A	20	10	100	10	0	N/A	
Copper Wire	0	0	0	N/A	0	0	0	0	0	N/A	
Glass	75.5	15	0	N/A	90.5	10.5	75	5	0	N/A	
! HDPE	0	0	0	N/A	0	3	0	0	0	N/A	

Figure 6. Error of validation for several materials in the Scenarios' tables (i.e. baseline total amount  $\neq$  alternative total amount)

Once the data has been entered, you can continue to the next step clicking "2. Further characteristics" (top of the page) or "Next" (bottom of the page). You can also navigate to other sections, like heading directly to the calculation if you want to keep all default options in the next sections. If the step "1.Scenarios" is left without having fixed possible invalid entries (i.e. total baseline  $\neq$  total alternative), a warning message is displayed informing of the existence of invalid data. The calculation can be run anyway, but the user should be aware of the existing differences in total quantities between scenarios.

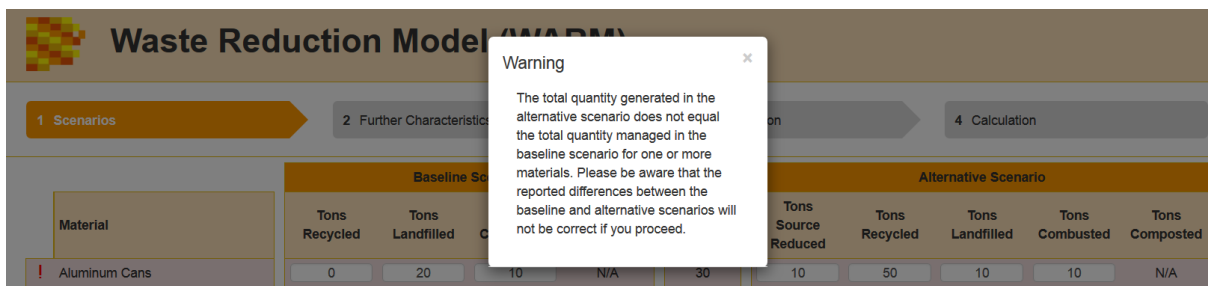

Figure 7. Warning message displayed if any material has invalid data entries

## 4.2. Further characteristics

Several key inputs affecting the GHGs and Energy results can be modified by the user. These are:

- Locations: they affect the emission factors for those management practices consuming/avoiding electricity. The specific regional grid mix is used depending on the state selected by the user in the drop-down menu. The value by default is "National Average".

Figure 8. Locations options in "Further characteristics" section of the "Data Entry" tab

- Waste Transport Characteristics: the distances covered between the location where the waste was collected and the correspondent management facility can also be

modified. The value by default is 20 miles. You can select the option "Define distance" to enter new values (also in miles).

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

▼ Waste Transport Characteristics

Emissions that occur during transport of materials to the management facility are included in this model. You may use default transport distances, 20 miles, or provide information on the transport distances for the various MSW management options.

☒ Use default distance  
☐ Define distance

Management option	Default Distance (miles)	Defined Distance (miles)
Landfill	20	<input type="text"/>
Combustion	20	<input type="text"/>
Recycling	20	<input type="text"/>
Composting	20	<input type="text"/>

Figure 9. Waste transport options in "Further characteristics" section of the "Data Entry" tab

- Source reduction: you can decide whether the material that is source reduced would have been manufactured from the current mix of recycled and virgin materials or from 100% virgin materials. The latter option would report a higher benefit from source reduction. The option by default is "Current mix".

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

▼ Source reduction

To estimate the benefits from source reduction, EPA usually assumes that the material that is source reduced would have been manufactured from the current mix of virgin and recycled inputs. However, you may choose to estimate the emission reductions from source reduction under the assumption that the material would have been manufactured from 100% virgin inputs in order to obtain an upper bound estimate of the benefits from source reduction. Select which assumption you want to use in the analysis. Note that for materials for which information on the share of recycled inputs used in production is unavailable or is not a common practice, EPA assumes that the current mix is comprised of 100% virgin inputs. Consequently, the source reduction benefits of both the "Current mix" and "100% virgin" inputs are the same

☒ Current Mix  
☐ 100% Virgin

Figure 10. Source reduction options in "Further characteristics" section of the "Data Entry" tab

- Landfill characteristics: you can determine the:
  - I) Type of landfill: there are four options available: No landfill gas (LFG) recovery, LFG recovery for energy, LFG recovery and flared, and a "National Average" type which calculates emissions based on the proportions of the other three types in 2012. Depending on the selection, the other two options for landfill characteristics will be modifiable or not. For instance, if "No LFG Recovery" is selected, there are no further options to be chosen. On the other hand, if "National Average" is selected, the option "(III) Moisture Conditions and Decay Rates" is also modifiable.

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

▼ Landfill Characteristics (I, II, III)

▼ I) Landfill Type

The emissions from landfilling depend on whether the landfill where your waste is disposed has a landfill gas (LFG) control system. If you do not know whether your landfill has LFG control, select "National Average", which calculates emissions based on the proportions of landfills with LFG control in 2012. If your landfill does not have a LFG system, select "No LFG Recovery". If a LFG system is in place at your landfill, select "LFG Recovery" and click one of the indented buttons to indicate whether LFG is recovered for energy or flared.

☒ National Average  
☐ No LFG Recovery  
☐ LFG Recovery

- ☒ Recover for energy
- ☐ Flare

Figure 11. Landfill type options in "Further characteristics" section of the "Data Entry" tab

II) Landfill Gas Recovery: only relevant if any "LFG Recovery" option has been chosen previously. It represents four different gas collection efficiencies throughout the life of the landfill: typical, worst-case, aggressive and California regulatory collections. Assumptions made for each option are explained in the tool.

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

☒ LFG Recovery

☒ Recover for energy

☐ Flare

▼ II) Landfill Gas Recovery

For landfills that recover gas, the landfill gas collection efficiency will vary throughout the life of the landfill. Based on a literature review of field measurements and expert discussion, a range of collection efficiencies was estimated for a series of different landfill scenarios. The "typical" landfill is judged to represent the average U.S. landfill, although it must be recognized that every landfill is unique and a typical landfill is an approximation of reality. The worst-case collection scenario represents a landfill that is in compliance with EPA's New Source Performance Standards (NSPS). The aggressive gas collection scenario includes landfills where the operator is aggressive in gas collection relative to a typical landfill. Bioreactor landfills, which are operated to accelerate decomposition, are assumed to collect gas aggressively. The California regulatory collection scenario allows users to estimate and view landfill management results based on California regulatory requirements.

☒ Typical operation - DEFAULT

☐ Worst-case collection

☐ Aggressive gas collection

☐ California regulatory collection

Landfill gas collection efficiency (%) assumptions

Typical: Years 0-1: 0%; Years 2-4: 50%; Years 5-14: 75%; Years 15 to 1 year before final cover: 82.5%; Final cover: 90%

Worst-case: Years 0-4: 0%; Years 5-9: 50%; Years 10-14: 75%; Years 15 to 1 year before final cover: 82.5%; Final cover: 90%

Aggressive: Year 0: 0%; Years 0.5-2: 50%; Years 3-14: 75%; Years 15 to 1 year before final cover: 82.5%; Final cover: 90%

California: Year 0: 0%; Year 1: 50%; Years 2-7: 80%; Years 8 to 1 year before final cover: 85%; Final cover: 90%

Figure 12. Landfill gas recovery options in "Further characteristics" section of the "Data Entry" tab

III) Moisture Conditions and Decay Rates: relevant if "National Average" or any "LFG Recovery" option has been selected as landfill type. You can select here between five moisture conditions and associated bulk MSW decay rates (k) the one which best represents the conditions in your assessed landfill. The options are: National Average, dry ( $k=0.02$ ), moderate ( $k=0.04$ ), wet ( $k=0.06$ ) and bioreactor ( $k=0.12$ ). A higher average decay rate means that waste decomposes faster in the landfill.

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

is in place at your landfill, select "LFG Recovery" and click one of the indented buttons to indicate whether LFG is recovered for energy or flared.

☒ National Average

☐ No LFG Recovery

☐ LFG Recovery

☒ Recover for energy

☐ Flare

► II) Landfill Gas Recovery

▼ III) Moisture Conditions and Decay Rates

Which of the following moisture conditions and associated bulk MSW decay rate (k) most accurately describes the average conditions at the landfill? The decay rates, also referred to as k values, describe the rate of change per year (yr<sup>-1</sup>) for the decomposition of organic waste in landfills. A higher average decay rate means that waste decomposes faster in the landfill.

☒ National Average - DEFAULT

☐ Dry ( $k = 0.02$ )

☐ Moderate ( $k = 0.04$ )

☐ Wet ( $k = 0.06$ )

☐ Bioreactor ( $k = 0.12$ )

Moisture condition assumptions

Dry ( $k=0.02$ ): Less than 20 inches of precipitation per year

Moderate ( $k=0.04$ ): Between 20 and 40 inches of precipitation per year

Wet ( $k=0.06$ ): Greater than 40 inches of precipitation per year

Bioreactor ( $k=0.12$ ): Water is added until the moisture content reaches 40 percent moisture on a wet weight basis

National average: Weighted average based on the share of waste received at each landfill type

Figure 13. Moisture conditions and decay rates options in "Further characteristics" section of the "Data Entry" tab

You can collapse or expand each of these sections by clicking on the section's header area.

### 4.3. General Information

This page is included with documentation purposes. You can include your organization's name, your name, the reporting period and a description of the assessment in the existing text fields. The data typed in here will be shown in the report generated after the calculation.

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

The following input are optional and may be used to customize your summary report.

Organization:

Name:

Reporting period:  to

Description:

Back Next

Figure 14. "General Information" section of the "Data Entry" tab

## 4.4. Calculation

Three types of calculations can be performed in the WARM tool:

- GHGs emissions in metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>E)
- GHGs emissions in metric tons of carbon equivalent (MTCE)
- Energy consumed in million BTU

1 Scenarios 2 Further Characteristics 3 General Information 4 Calculation

▼ Calculation Properties

Please select the result output unit:

☒ Metric Tons of Carbon Dioxide Equivalent (MTCO<sub>2</sub>E)

☐ Metric Tons of Carbon Equivalent (MTCE)

☐ Units of Energy (million BTU)

You can return to this screen to generate results with another output unit once the initial report has been generated.

Calculate

Figure 15. "Calculation" section of the "Data Entry" tab

After selecting the preferred calculation option, click on "Calculate" to get the results in a new tab "Report". You might need to wait a bit longer for the calculation to complete for the initial run.

## 5. Results

There are three sub-tabs within the "Report" tab created after the calculation: summary, analysis and charts.

How to interpret the results presented in them? If a GHG emission value is negative, it means that those emissions have been avoided during the waste management of that specific material type and/or scenario. Likewise, if an energy consumption is negative, it means that the modelled scenario avoids the consumption of that amount of energy. If the total change between the alternative and baseline scenario is negative, then the alternative scenario will imply less GHG emissions or energy consumption than the baseline, and vice versa.

Only those materials for which data has been entered in the scenarios creation will be presented in the results.

As in the scenarios' tables, there are also tooltips for each cell/bar of the different results' tables/charts containing information about the data displayed in them.

## 5.1. Summary

It contains a table similar to the one in "1 Scenarios" but including also the GHG emissions/Energy consumption per material and scenario. In addition, there is an additional column in the right side with the change between the two scenarios (i.e. Alternative-Baseline) for the metric selected in the calculation properties.

Moreover, there are in the bottom right of the page some equivalencies to the resulting total change. For example, it is included the amount of passenger vehicles' annual emissions equivalent to the total change in GHG Emissions. Depending on the sign of the total change, this equivalency will be presented as removal of annual emissions (if the sign is negative) or adding of emissions (if the sign is positive).

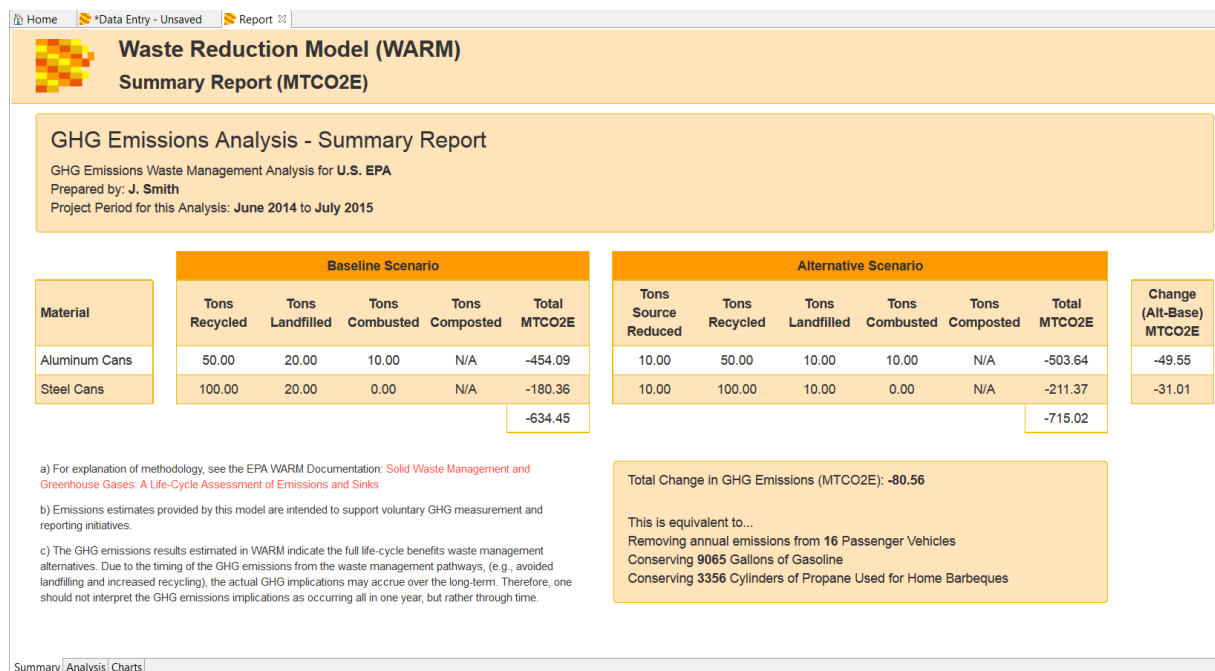

Figure 16. "Summary" tab of the report

## 5.2. Analysis

This tab contains four sections:

- Emission factors: it contains the emission factors (in the selected metric) per relevant material type and management practice. The tons specified per material and management practice are multiplied by these factors to obtain the GHG emission/Energy consumption results.

Home \*Data Entry - Unsaved Report

## Waste Reduction Model (WARM)

### Analysis Report (MTCO<sub>2</sub>E)

Total GHG Emissions from Baseline MSW Generation and Management (MTCO<sub>2</sub>E): -634.45  
 Total GHG Emissions from Alternative MSW Generation and Management (MTCO<sub>2</sub>E): -715.02  
 Incremental GHG Emissions (MTCO<sub>2</sub>E): -80.56

MTCO<sub>2</sub>E = metric tons of carbon dioxide equivalent

Emission factors	Emissions from Baseline	Emissions from Projected Alternative	Incremental Emissions from Projected Alternative		
Material	GHG Emissions per Ton of Material Source Reduced (MTCO <sub>2</sub> E)	GHG Emissions per Ton of Material Recycled (MTCO <sub>2</sub> E)	GHG Emissions per Ton of Material Landfilled (MTCO <sub>2</sub> E)	GHG Emissions per Ton of Material Composted (MTCO <sub>2</sub> E)	GHG Emissions per Ton of Material Composted (MTCO <sub>2</sub> E)
Aluminum Cans	-4.92	-9.11	0.04	0.05	N/A
Steel Cans	-3.06	-1.81	0.04	-1.55	N/A

a) For explanation of methodology, see the EPA WARM Documentation: *Solid Waste Management and Greenhouse Gases: A Life-Cycle Assessment of Emissions and Sinks*

b) Emissions estimates provided by this model are intended to support voluntary GHG measurement and reporting initiatives.

Figure 17. "Emission factors" section in the "Analysis" tab of the report

- Emissions from Baseline: it contains the tons handled and the resulted GHG emission/Energy consumption per relevant material and management practice, as well as the totals per material, for the baseline scenario.

Emission factors		Emissions from Baseline		Emissions from Projected Alternative		Incremental Emissions from Projected Alternative				
Material	Baseline Generation of Material (Tons)	Projected Recycling (Tons)	Annual Energy Use from Recycling (million BTU)	Projected Landfilling (Tons)	Annual Energy Use from Landfilling (million BTU)	Projected Combustion (Tons)	Annual Energy Use from Combustion (million BTU)	Projected Composting (Tons)	Annual Energy Use from Composting (million BTU)	Total Annual Energy Use (million BTU)

b) Emissions estimates provided by this model are intended to support voluntary GHG measurement and reporting initiatives.

Figure 20. "Incremental Emissions from Projected Alternative" section in the "Analysis" tab of the report

### 5.3. Charts

Contributions per flow, material type, management practice and pre-determined group of processes are presented as bar charts in four different sections:

- Flow contributions: in the GHG emissions calculation (i.e. MTCO<sub>2</sub>E, MTCE), the contribution per GHG flow assessed is presented for each scenario. The elementary flows displayed are:
  - Resources:
    - Carbon (forest storage)
    - Carbon (landfill storage)
    - Carbon (soil storage)
  - Air emissions:
    - Carbon dioxide
    - Dinitrogen monoxide
    - Ethane, hexafluoro, HFC-116
    - GHGs, unspecified
    - Methane
    - Methane, tetrafluoro, R-14

In the Energy consumption calculation, a single flow is displayed "Energy, unspecified" (resource) for both scenarios.

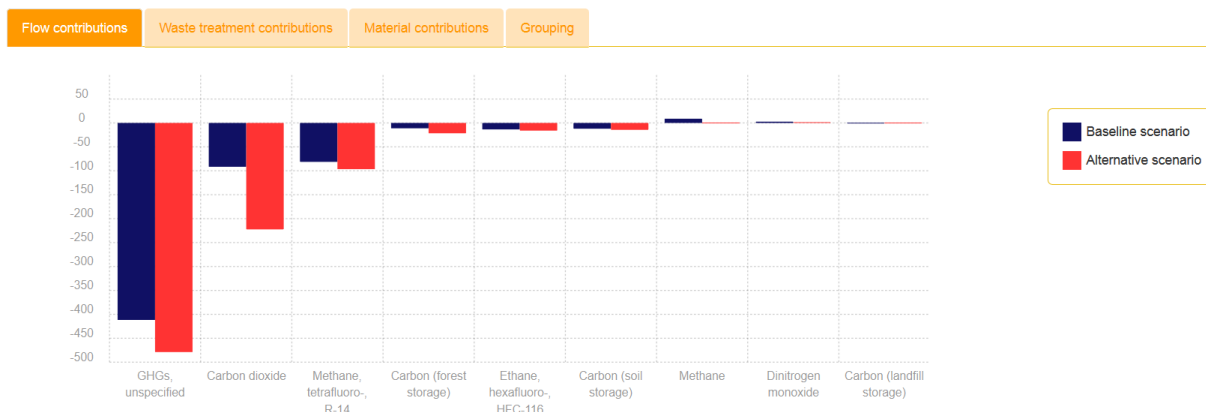

Figure 21. "Flow contributions" section in the "Charts" tab of the report

- Waste treatment contributions: the GHG emissions/Energy consumption per waste management option is presented here for each scenario and a maximum of six materials. The materials to be displayed can be selected clicking on the "Select

material filter" button. A pop-up window with the relevant materials will be shown; once the materials have been chosen, click on "Apply selection".

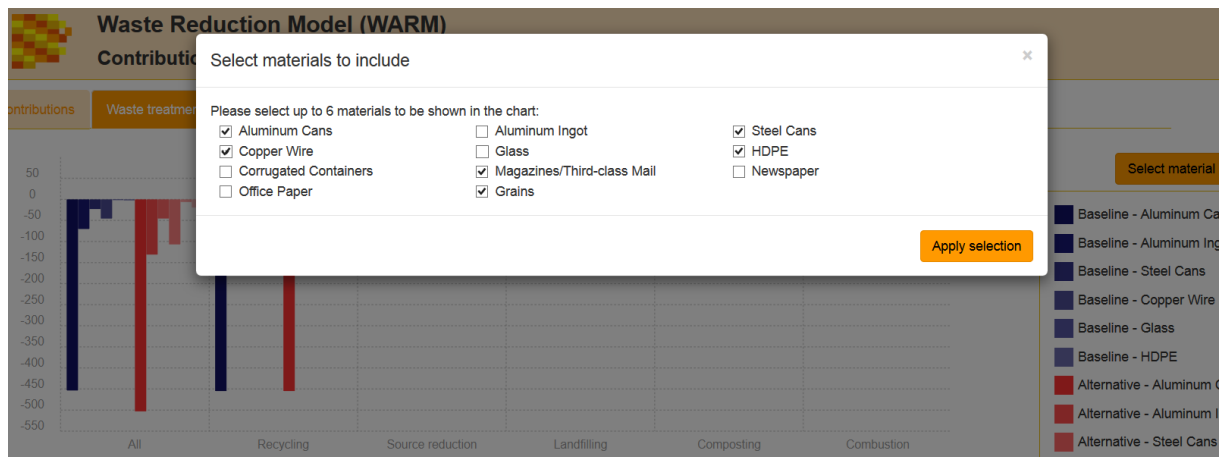

Figure 22. "Select materials filter" window in the "Waste treatment contributions" section of the "Charts" tab of the report

- Material contributions: the GHG emissions/Energy consumption per material type is presented here for each scenario and management practice. As in the previous chart, only up to six materials can be presented simultaneously. The materials to be displayed can be selected clicking on the "Select material filter" button.

Figure 23. "Material contributions" section in the "Charts" tab of the report

- Grouping: it contains GHG emissions/Energy consumption results per each pre-defined group of processes used in the WARM life cycle product system created in openLCA. The groups presented are:
  - landfilling
  - combustion
  - recycling
  - source reduction
  - composting
  - electricity
  - heavy equipment for composting
  - heavy equipment for landfilling
  - transport
  - forest carbon sequestration
  - other

For instance, "transport" will show the contribution to the total results of all processes related with transportation of waste to management facilities, transportation within the management facilities and transport to retailer. It should be noted that in the "source reduction" group all the manufacturing processes, including also energy and transport required during the manufacturing, are considered, and that these processes are used in the supply chain of both recycling and source reduction management practices.

## 5.4. Report export

All the content of the "Report" tab can be exported as HTML by clicking on the icon  of the toolbar. The exported file can then be opened in any modern web browser. The only difference with the view in the WARM Tool is that the report's tabs "Summary", "Analysis" and "Charts" are included in the exported file as buttons in the top-right of the page.

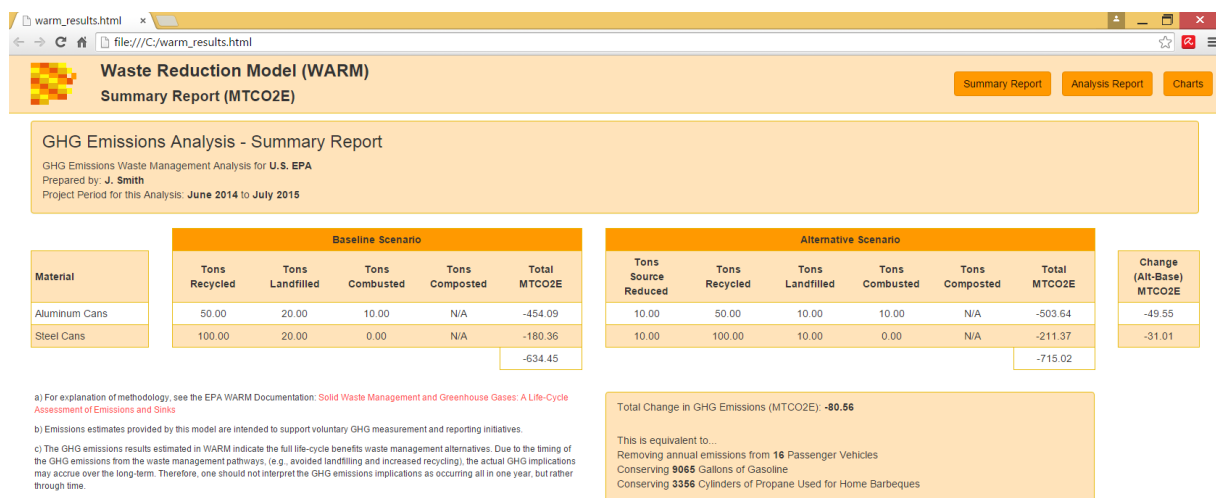

Figure 24. WARM Report exported as HTML opened in a web browser

## 6. Saving data

All the inputted data and selected options from the "Data Entry" tab can be saved in a file with the extension \*.warm and be opened again in the tool for further assessments. To this end, select "File" in the menu bar and choose between any of the existing options (i.e. "Save", "Save as", "Save all"). For opening an existing file, select the option "Open...". The files with extension \*.warm can only be opened from within this WARM Tool.

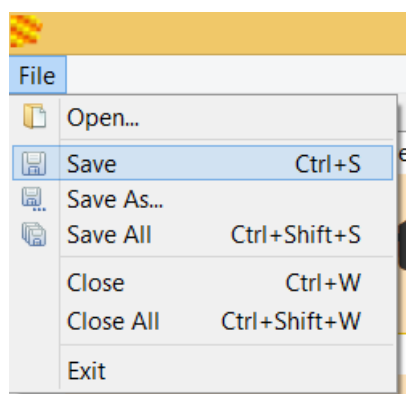

Figure 25. "File" menu options

The save/open functions are also available in the toolbar.

All the tabs that remain opened when closing the application will be displayed again the next time the tool is run. If you want to close permanently any tab, use the "Close" and "Close All" options of the "File" menu or click on the white cross in the right of the tab's header.

## 7. Other features

You can display several tabs at the same time in the tool by dragging and dropping the tabs into different positions in the window. Please, note that if the size of the window is too small, some elements might not be displayed properly (e.g. data entry tab).
